Pre-processing and cleaning data: Predicting House Prices using Machine Learning

A Case Study of Saudi Arabia

1. Importing the Libraries

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

2. Load the dataset

```
In [ ]: AQAR_Data = pd.read_csv(r"../../DataSet/aqarItemsData19971.csv")
df = AQAR_Data.copy()
```

3. Drop Features

We have some faetures that we want to drop because they do not add any value to the project like:

- id
- title
- description
- ad number
- last_update
- views

```
In [ ]: df.drop(columns=['id','title','description','ad_number','last_update','views'], axis=1, inplace = True)
```

Dataframe after droping features:

In []:	df	df.head()														
Out[]:		city	district	front	rooms	living_rooms	bath_rooms	street_width	level	age	kitchen	garage	elevator	area	dimensions price	
	0	جدة	حي الروابي	الية غربية	4 شم	NaN	3	م15	4	8	1.0	1.0	1.0	103 م²	420,000 ريال م طول - 13م عرض7	
	1	الدمام	حي الفردوس	جنوبية .	3	2.0	3	م5	أرضي	جديد	1.0	1.0	1.0	144 م²	NaN 610,000 ریال	
	2	ابها	حي القريقر	شرقية	2	1.0	2	م20م	أول	جديد	1.0	NaN	1.0	340 م²	960,000 م طول - 100م عرض3 ريال	
	3	الدمام	حي النور	ربية غربية	5 جنو	1.0	3	م40	NaN	جديد	NaN	1.0	1.0	182 م²	500,000 و 500,000 عرض 10 ريال	
	4	الدمام	حي النور	الية غربية	5 شە	1.0	3	م30	أرضي	جديد	1.0	NaN	NaN	197	580,000 ريال م طول - 5م عرض39	

4. Fix missing data

We have some missing data and we want to fix this data.

All these values will be replaced to 0 or 1 by default. The 1 means that all this data is in the houses, The 0 means that all this data is not in the houses, and it was not mentioned in the AD

```
In []: df['level'].fillna(value = 0, inplace = True)
    df['age'].fillna(value = 0, inplace = True)
    df['kitchen'].fillna(value = 1, inplace = True)
    df['garage'].fillna(value = 0, inplace = True)
    df['elevator'].fillna(value = 0, inplace = True)
    df['living_rooms'].fillna(value = 0, inplace = True)
    df['bath_rooms'].fillna(value = 1, inplace = True)
```

4.1 fix the area feature

```
In [ ]: df['area'] = df['area'].str.split().str[0]
df['area'] = df['area'].str.replace(',','')
```

```
df['area'] = df['area'].str.replace('0','²ه')
         df['area'] = df['area'].astype('int')
         df['area'].unique()
Out[]: array([ 103,
                          144,
                                 340,
                                        182,
                                               197,
                                                             297,
                                                                    179,
                                                                           131,
                                                                                  230,
                                                                                         252,
                                                     112.

5. Removing Outliers

dtypes: int32(11), object(4)
memory usage: 1.6+ MB

14 price

19956 non-null int32

Outliers are data points that exist far away from the majority of your data. This can happen due to several reasons, such as incorrect data recording to genuine rare occurrences. Either way you will often want to remove these values as they can negatively impact your models.

An example of the negative effect can be seen here where an outlier is causing almost all of the scaled data to be squashed to the lower bound.

5.1 Target Variable "price" Visualization with Outliers boundaries using Standrad Deviation

```
In []: # Making a histogram of the price variable and adding Standard deviation based detection"
    f, ax = plt.subplots(figsize = (24,6))
    ax = sns.histplot(x= df['price'], kde= True)

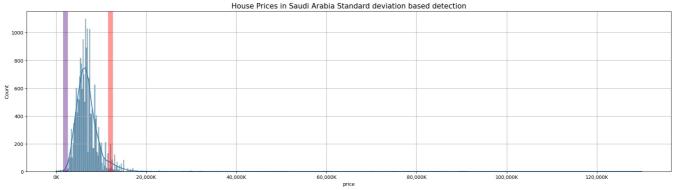

# choose 1.7 standard deviation from the mean:
    factor = 1.2

# define upper:
    upper_lim = df['price'].mean () + df['price'].std () * factor

# define lower:
    lower_lim = df['price'].mean () - df['price'].std () * factor

#Plot upper and lower based on 1.2 standard deviation from the mean:
    ax.axvline(upper_lim, color='red', ls='-', alpha=0.4, lw=10)
    ax.axvline(lower_lim, color='indigo', ls='-', alpha=0.4, lw=10)
    ax.set_title('House Prices in Saudi Arabia Standard deviation based detection', fontsize=15)
    xlabels = ['t:,.0f]'.format(x) + 'K' for x in ax.get_xticks()/100]
    ax.set_xticklabels(xlabels)
    plt.grid(True)
```

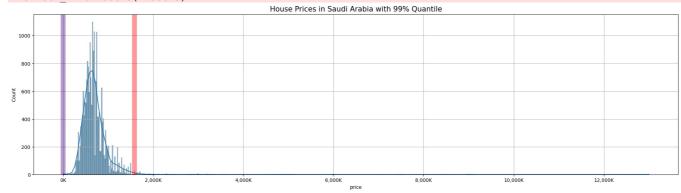

C:\Users\hasoo\AppData\Local\Temp\ipykernel_47252\479889413.py:19: UserWarning: FixedFormatter should only be u
sed together with FixedLocator
ax.set_xticklabels(xlabels)

5.2 Target Variable "price" Visualization with Outliers boundaries using Quantile

```
In []: # Making a histogram of the price variable and Quantile based detection
    f, ax = plt.subplots(figsize = (24,6))
    ax = sns.histplot(x=df['price'], kde=True)
    # define upper using 99th quantile:
    upper_lim = df['price'].quantile(0.99)
    # upper quantile:
    lower_lim = df['price'].quantile(0)
    #Plot upper and lower based on 0th, 99th quantile:
    ax.axvline(upper_lim, color='red', ls='-', alpha=0.4, lw=10)
    ax.axvline(lower_lim, color='indigo', ls='-', alpha=0.4, lw=10)
    ax.set_title('House Prices in Saudi Arabia with 99% Quantile', fontsize=15)
    xlabels = ['{:,.0f}'.format(x) + 'K' for x in ax.get_xticks()/1000]
    ax.set_xticklabels(xlabels)
    plt.grid(True)
```

C:\Users\hasoo\AppData\Local\Temp\ipykernel_47252\1611047075.py:13: UserWarning: FixedFormatter should only be used together with FixedLocator ax.set xticklabels(xlabels)

5.3 Outliers: Standard deviation based detection

```
In [ ]: factor = 1.2
    upper_lim = df['price'].mean () + df['price'].std () * factor
    lower_lim = df['price'].mean () - df['price'].std () * factor

df_std = df[(df['price'] < upper_lim) & (df['price'] > lower_lim)]
```

5.4 Outliers: Quantile based detection

```
In [ ]: upper_lim = df['price'].quantile(0.99)
lower_lim = df['price'].quantile(0.01)

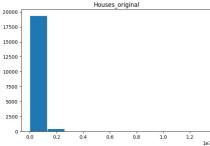

df_quant = df[(df['price'] < upper_lim) & (df['price'] > lower_lim)]
```

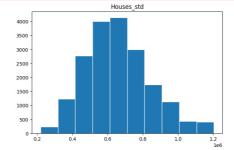

5.5 Visualization all outliers: Target Variable "price" Visualization

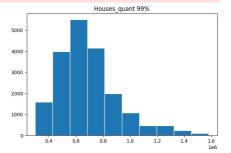

```
In []: plt.subplots(figsize = (24,10))
   plt.subplot(2,3,1)
   plt.hist(df[['price']], edgecolor='white')
   plt.title('Houses_original')
   plt.subplot(2,3,2)
   plt.hist(df_std[['price']], edgecolor='white')
   plt.title('Houses_std')
   plt.subplot(2,3,3)
   plt.hist(df_quant[['price']], edgecolor='white')
   plt.title('Houses_quant 99%')
   plt.show()
```

C:\Users\hasoo\AppData\Local\Temp\ipykernel_47252\4035440049.py:2: MatplotlibDeprecationWarning: Auto-removal o f overlapping axes is deprecated since 3.6 and will be removed two minor releases later; explicitly call ax.rem ove() as needed.

plt.subplot(2,3,1)

```
In []: sns.boxplot(df['price'])
```

Out[]: <AxesSubplot: >
